A high percentage of pigs with inserts are still contaminated with blood on arrival. According to a study, 5.8% of the insert pigs were found to be contaminated with blood before dose administration.\(^1\) Technologists and patients are exposed to a potential route of environmental transmission of bloodborne pathogens.

---

Our PROPRIETARY use of the U.S. Patented sterilization process kills bacteria and viruses with the combination of a disinfectant and high washing temperature, providing an optimum level of sterilization.
